Infestation-Level–Based Management Practices for Mango Pulp Weevil

Low Infestation Rate

- **Early fruit bagging (Jackson, 2021; CABI, 2019)**

  Monitor mangoes and bag them using newspaper while they are still immature, typically 50-60 days after fruit set, or the mangoes have reached a chicken-egg size. This ensures that the mangoes are protected before the peak oviposition period.

- **Routine Orchard Sanitation (Jackson, 2021; Medina et al., 2005; Ndalamei, 2015)**

  Regularly collect fallen, damaged, or suspicious fruits from the orchard floor and bury them around 50 cm deep. This ensures that any fallen mangoes that may contain mango pulp weevil can never reinfest again.

Moderate Infestation Rate

- **Strict Orchard Sanitation (Jackson, 2021; Medina et al., 2005; Ndalamei, 2015)**

  Orchard sanitation must be done more often to ensure no reinfestation may occur. All fallen fruits should be immediately collected and destroyed by burying them to a minimum of 50 cm of depth.

- **Open-center Pruning (Medina et al., 2005)**

Remove a few branches on the tree to have more sunlight coming in. Direct sunlight into the inner parts of the tree creates unfavorable conditions for the mango pulp weevil.

- **Early Fruit Bagging (CABI, 2019)**

Early fruit bagging can also be done in a moderate infestation level, which ensures that mangoes can be protected from the mango pulp weevil.

High Infestation Rate

- **Intensive field sanitation (Jackson, 2021; Medina et al., 2005; Ndalamei, 2015)**

Field sanitation must still be conducted in high infestation levels to lower the effect of the mango pulp weevil. Immediately remove any fallen fruit from the orchard and destroy it.

- **Strict open-center pruning and canopy management (Medina et al., 2005)**

Open-center pruning must still be conducted, and a few branches of the tree should have more direct sunlight in the inner parts of the tree. This must be done as regular practice, not a one-time-only. Monitor the mango trees and take action immediately if the canopy becomes dense again.
